Custom Fields

Legacy Custom Fields

Database Extensions

Legacy Custom Fields

- System - Custom Fields/Screens
- Only for Student, Staff (teachers table), Course and Section
- Only text fields
- One giant custom field
- Limit of 999 total fields for a given table (core + custom)

The Old Way. *With custom fields, all custom data is stored in a single field in the core table. They are all "Text" types.*

Students Table	
Last_Name	Adair
First_Name	Brandon
DCID	2
ID	5
CUSTOM	Medical Notes: Allergic to peanuts contact_1_email: contact1@email.com contact_2_email: contact2@email.com contact_1_employer: Wal Mart contact_2_employer: Lanham Law Offices parent_notes: Brandon is only allowed to be picked up from school on Wednesdays by his father.

Database Extensions

- System – Page and Data Management – Manage Database Extensions
- REAL tables and fields
- Migration options for legacy custom fields:
 - all-at-once (not recommended)
 - one-at-a-time
- One-to-one, one-to-many, standalone
- "Group" organization. (U_STUDENTS_EXTENSION)
 - U_VEX, U_ETX, U_FSH

Database Extensions - The New Way. *Faster, real tables and fields, multiple data types.*

Students	<i>Core Table "Parent"</i>		U_Def_Ext_Students	<i>New extended table "Child"</i>
Last_Name	Adair			
First_Name	Brandon		<i>This table "relates" to the Students table</i>	
DCID (Primary Key)	2	<->	StudentsDCID (Foreign Key)	2
ID	5		Contact1_Email	contact1@email.com
			Contact2_Email	contact2@email.com
			Contact1_Employer	Wal Mart
			Contact2_Employer	Lanham Law Offices
			Medical_Notes	Allergic to Peanuts

Using Custom Fields

Functional Area	Legacy Custom Fields	Database Extensions (one-to-one)
In searches, lists, exports and wherever it asks for a "fieldname"	Fieldname Example: <code>DistrictID</code>	ExtensionGroupName.Fieldname Example: <code>U_Students_Extension.DistrictID</code>
Reports that use DATs	~(Fieldname) Example: ~(DistrictID)	~(ExtensionGroupName.Field_Name) Example: ~(U_Students_Extension.DistrictID)
Custom Pages (HTML)	[PrimaryTable]Fieldname Example: [Students]DistrictID	[PrimaryTable.ExtensionsGroupName]FieldName Example: [Students.U_Students_Extension]DistrictID

IT'S TIME TO
MIGRATE

Legacy

Database Extensions

- Core and Core2
- State Reporting
- Activities
- User-created (still optional)

If user-created custom field migration has been performed on the server, you cannot create legacy custom fields

web_root

CPM
(Custom Page
Management)

Page Locations

Core web_root

This is the location where all the stock pages updated by PowerSchool are served from. No need to access and NOT advisable to modify

**<PS Install Folder>\application\components
\powerschool-core-<<version_number>>
\system\server\resources\web_root**

Page Locations

Custom
web_root

Legacy location for custom pages. If using modern CPM the best practice is to make sure everything is migrated to CPM and removing files from this folder

<PS Install Folder>\data\custom\web_root

Page Locations

CPM
(Custom Page Management)

NOT a folder! CPM stores custom pages in the database and there is a web interface for working with them.

Before version 12.1

Start>PS Administrator>Custom Pages

- Separate portal requiring separate account

12.1 and later

Start>System>Page and Data Management>Custom Page Management

- Within admin portal, no separate account required.
- Must setup permissions

Page Locations

CPM
(Custom Page Management)

The "What's New in PowerSchool 12.1" presentation has screenshots of how to enable the new CPM

- **"What's New in PowerSchool 12.1" on PowerSource at <https://support.powerschool.com/exchange/view.action?download.id=958>**
- **Presented on the PowerSchool Insider Episode 54**

Page Locations

CPM (Custom Page Management)

A great alternative CPM editor created by a power user:

"Blue Steel CPM"

(Exchange ID 749)

- Upload multiple files
- Search for files
- Filter by plugin names

Blue Steel Custom Page Management (CPM)

[b]PowerSchool 12.1 Users[/b] Make sure you have access to the stock CPM before using. A new more functional version of Custom Page Management (CPM). This was created to have a better interface to CPM and make it easier to customize. [ul] [*]Ctrl+S or Command+S to save [*]Multiple file upload [*]Search [*]Show Customizations only [*]Snippets - ability to create your own reuseable pieces of code to insert [*]Templates - ability to ... Best Practice: Clear out custom web_root once you begin using CPM.

But if you have this issue, copying the core content to CPM can be a temporary workaround.

Dissecting a PowerSchool Page

Special Page extensions

.htmlr

Render the page in the browser but do not process special PowerSchool tags.

.htmlt

View the unrendered (server-side) page code in the browser window

Right-click (Windows) or Control-click (Mac) on a PowerSchool page and choose "Inspect" or "View Page Source" to see the rendered (client-side) code.

Tip: Student pages are in "frames". To use these special extensions right-click (ctrl-click) on the link to them and "Open link in new tab"
